What this document is

This Data Dictionary defines every variable that flows from the field worker's data-entry form through to the KPIs the Executive Director reads on the dashboard. It covers three things: (1) raw inputs collected in the field, (2) KPIs calculated automatically by the system, and (3) the validation rules that prevent bad data from corrupting results.

Section 1 — Raw Field Inputs

These five fields are entered by the field worker after each programme cohort completes. They are the only source of data for all KPI calculations.

Field	Data type	Allowed values	Example	What it captures
Field Worker ID	Text (string)	Format: FW-001 to FW-999. Required. No blanks allowed.	FW-042	Identifies who submitted each record. Helps supervisors trace errors back to the source and follow up with the right person
District	Dropdown	Haridwar Dehradun Roorkee Rishikesh. No free text.	Haridwar	Determines regional grouping of KPIs and enables district-level comparison on the dashboard.
Beneficiaries Served	Integer	Zero and blank rejected. Must be whole number. Invalid inputs like Alphabets or special characters will output an immediate error on screen and force the worker to fill a valid input thereby ensuring data accuracy.	28	Count of youth who completed the cohort (≥80% attendance + assessment submitted). Denominator in Cost Per Impact.
Budget Allocated (INR)	Float (₹)	1.00 – 10,000,000.00. Zero and blank rejected. Again alphabets, negative integers and special characters except(.) generate real time error and asks to re-enter a valid input.	₹34,500	Total direct spend for this cohort — trainer fees, materials, venue. Overhead excluded unless approved. Numerator in Cost Per Impact.
Successful Placements	Integer	Negative values and decimals rejected. Invalid data types return error on screen.	21	This data is used to find the Job Placement Rate (JPR) (%) (Target>75%), a primary outcome metric. JPR= Successful Placements/Beneficiaries_Served *100

Section 2 — Calculated KPIs

These four metrics are computed automatically by the dashboard from the raw inputs above. No manual entry. Calculated on every data refresh across all validated records. Works in real-time domain and as soon as a field worker inputs the data records, it shows up on the dashboard.

Total Lives Impacted	Avg Cost Per Impact	Job Placement Rate	Total Capital Deployed
14,045	₹338.78	76.2%	₹3,738,445
Sum of unique beneficiaries trained	Lower value indicates higher capital efficiency	Target benchmark: >75%	Total field expenditure

KPI	Formula	Target	What it tells you
Cost Per Impact	Budget Allocated ÷ Beneficiaries Served	Lower is better. District median used as reference.	<i>The main efficiency metric. How much the NGO spends per young person who completes the programme. Spikes flag delivery or drop-out problems.</i>
Total Lives Impacted	SUM of all Beneficiaries Served across selected date range and district	Set annually by Programme Director.	<i>Headline reach figure for donor reports and board presentations. Counts completions, not enrolments.</i>
Job Placement Rate (%)	AVG of Employment Retention Rate across all records in scope	> 75%. Below 60% triggers an alert.	<i>Primary outcome metric. Sustained performance below 60% warrants a curriculum or placement-partner review.</i>
Total Capital Deployed (INR)	SUM of all Budget Allocated values across selected scope	Variance >10% vs. approved budget flags a utilisation alert.	<i>Financial accountability metric. Compared against the approved programme budget to compute utilisation rate and detect over/under-spend by district.</i>

Section 3 — Data Quality Rules

These rules prevent bad data from entering the KPI pipeline.

Rule	When triggered	What happens	Why it matters
Zero-division guard	Beneficiaries Served = 0 or blank	Error shown to field worker. Asked to re-enter a valid input	Division by zero in Cost Per Impact produces an undefined result that corrupts district averages.
Missing financial data	Budget Allocated = 0 or blank	Error shown to field worker again asking to re-enter a valid budget	A zero budget produces a Cost Per Impact of zero, which falsely inflates efficiency scores.
Unregistered worker ID	Entering the worker ID is a compulsory field	Data cannot be submitted unless a valid worker ID is entered	This prevents unauthorised people from filling in wrong data intentionally or unintentionally thereby ensuring authenticity of the data
